

ABSTRACT OF THE DISCLOSURE

A portable system for transferring liquids, such as diesel fuel, from a first tank, such as a railcar, to a second tank, such as on a transport truck. The system is self-contained and comprises a pump driven by an engine fueled by the liquid being transferred. A meter measures the amount of liquid being transferred. An inlet hose is used to connect the system to the railcar, and an outlet hose is used to connect the system to the transport truck. Air from the truck may be used to blow any liquid out of the outlet hose after a transferring operation.
